

CASE STUDY

REYNDERS label printing

Automation and 100% Verification of ScanTrust QRcodes for Secure Packaging Printing

REYNDERS label printing's roots date back to 1956, when its founder, Emile Reynders, started a humble stationery printing business from his family home. Today, the company, headquartered in Boechout, Belgium, has grown to become one of the leading label printing specialist in Europe, with over 70 printing presses across eight production facilities throughout Europe and Asia.

Reynders is driven by the belief that to maintain competitive advantage, it must constantly reinvent itself in order to succeed. This innovative culture to embrace new ideas, technology and opportunities, with a strong focus on process excellence, has enabled Reynders to respond to the most challenging of customer requirements. So when a prestigious consumer brand wanted a cost-effective solution to prevent their product packaging from being copied by counterfeiters, Reynders rose to the challenge.

ANTI-COUNTERFEIT PACKAGING

Preventing the counterfeiting of sensitive and vulnerable products, such as pharmaceuticals, agro-chemicals and cosmetics, is a multi-billion dollar business globally. Here, packaging plays a crucial role by thwarting crime that not only reduces profits, but causes economic damage and risks the health and potentially the lives of consumers.

Using traditional authentication technologies such as special inks & dyes, taggants, hologram and watermarks, either printed directly on the packaging or via an authentication label, can substantially increase production complexity and therefore costs. Track and Trace authentication technology using a variable QRcode offered a more cost-effective solution as it can be printed directly onto packaging substrate. However, QRcodes are relatively easy to duplicate, leaving the packaging vulnerable to being forged.

Enter ScanTrust, a secure cloud-based product authentication and supply chain traceability specialist, which offered a simple but revolutionary solution for protecting a product's authenticity and building customer trust. As Marc Reynders, CEO of Reynders explains, "ScanTrust's technology involves printing a secure QRcode, containing a unique fingerprint pattern that cannot be copied and can be easily verified using a mobile app. No special printing equipment, ink or paper was required making this the ideal, cost effective solution we were looking for to satisfy our clients' requirements."

When the Reynders Project Team started working on integrating the ScanTrust technology into their printing workflow, they soon came across a number of issues.

CHALLENGES

One of the key requirements of using the ScanTrust secure code technology was that the unique fingerprint pattern within the QRcode, had to be printed at 1,200 DPI resolution. Another was that at the start of a print run, the first few QRcodes, with its embedded fingerprint, had to be verified against ScanTrust's cloud based server to ensure the codes were readable, registered and authenticated, before full production could commence.

Reynders already had a colour digital press with all the required capabilities – web width, speed and most importantly the 1,200 DPI resolution needed to print the packaging job incorporating the ScanTrust secure codes. However, verifying and authenticating the code proved to be more of a challenge.

"Using a smartphone, with the ScanTrust app, to scan secure codes at the start of every job, worked fine for low print volumes. However, for large print runs, a fully automated solution was required to enable us to meet our productivity targets," said Sebastiaan Reynders, production leader for digital printing at Reynders. "Furthermore, we had no way of determining whether the print quality of the secure codes were being maintained throughout the entire print run. This meant that we could not guarantee the readability of the codes and therefore the integrity of the whole application."

It became clear that an automated solution was required to both automate the initial code authentication process and to monitor the print quality, and therefore the integrity of every ScanTrust secure code.

REYNDERS

CUSTOMER PROFILE

- Headquartered in Boechout, Belgium, REYNDERS label printing is one of Europe's leading providers of innovative label and packaging printing solutions
- Clients include leading brands in cosmetics, agro-chemicals, pharmaceuticals, food & drink and distribution industries
- 70 printing presses across 8 production sites in Belgium, West and Eastern Europe and Asia.

BUSINESS CHALLENGES

- To accurately capture, read and validate the ScanTrust QRcode, incorporating its secure fingerprint in real-time, on packaging as they exited the high resolution, digital colour press
- Authenticating the ScanTrust secure code using a Mobile Phone App, prior to commencing a job was tedious, time consuming and error prone for Operations
- Sampling of the ScanTrust code during the print job was impractical, impacted productivity and operational efficiency, and did not satisfy the clients' requirements.

SOLUTION SUMMARY

- Implemented DISCOVERY Multiscan incorporating a 16K Linescan camera to capture ScanTrust secure codes at the required resolution
- DISCOVERY Multiscan, with a custom Barcode Reading tool was developed to read and validate every QRcode and authenticate the unique fingerprint via ScanTrust's cloud server
- At the start of a job a positive authentication response to DISCOVERY Multiscan would enable the Operator to commence printing
- An integration with an offline ScanTrust quality validation tool, allowed the Operator to monitor the quality of the fingerprint image throughout the job
- If the ScanTrust code failed to authenticate or if the quality of the fingerprint falls below a quality threshold, DISCOVERY Multiscan would stop production to enable the Operator to investigate.

CASE STUDY

SOLUTION

Following a detailed review, Reynders and ScanTrust concluded that a custom, camera based inspection solution would be required to automate the ScanTrust QRcode authentication process. As Justin Picard, ScanTrust's Co-founder and CTO recalls, "Having previously spoken with Lake Image Systems at various trade events, I knew that they were one of the few companies that had the camera technology and software expertise to read the ScanTrust QRcode, capture a high resolution image of the unique fingerprint and integrate with our cloud-based authentication platform, so as to automate the process to Reynders' satisfaction."

Picard facilitated a workshop with Lake Image Systems and Reynders and a solution was quickly architected and developed.

Lake Image Systems installed its latest I6K Line scan camera to capture high resolution images of the ScanTrust code as they exited the digital colour press. These images were then processed by DISCOVERY Multiscan to read, decode and validate the QRcode, extract the unique fingerprint image and interrogate the ScanTrust cloud system to authenticate the code at the start of each job. A positive response from the ScanTrust cloud would allow DISCOVERY Multiscan to signal to the operator to commence printing the rest of the job.

Furthermore, throughout the job, DISCOVERY Multiscan continued to read and validate each QRcode and via an integration with an offline ScanTrust tool, the quality and integrity of the fingerprint was also assured. This solution enabled Reynders to fully automate the process, whilst ensuring that each and every code they printed was readable and valid and thereby satisfying a critical client requirement.

IMPACT

Today, the inspection solution from Lake Image has eliminated the time consuming and error-prone manual steps the operators had to perform before every job, allowing them to focus on more important tasks.

The versatility of DISCOVERY Multiscan, in combination with powerful camera technology, has turned a challenging operational issue into a viable, secure and profitable printing service for Reynders. "Although we use camera-based inspection technology in other parts of our business, we were impressed with the full range of print quality inspection and data verification capabilities available to us at an affordable price. We were particularly pleased with their expertise to understand our specific issues and then to quickly develop and implement a working solution in collaboration with ScanTrust," said Sebastiaan Reynders.

"As an organisation, we pride ourselves in delivering the highest levels of quality whilst maintaining operational and technical excellence at all times," said Marc Reynders. "With the combined ScanTrust and Lake Image solution in place, we can now fully automate our workflow according to our high standards and have the reassurance that we are delivering a quality, error-free product to this prestigious client."

Furthermore, the Lake Image solution has given Reynders the confidence to exploit the full potential of the ScanTrust technology. "The market for a highly effective, traceable, and low cost solution for producing secure packaging is expanding fast," commented Marc Reynders. "With this solution, we are now well positioned to benefit from this growth and are already delivering this secure packaging solution to two additional clients, with a few more in the pipeline."

BUSINESS BENEFITS

- Automating the ScanTrust authentication process has enabled faster, error free production, whilst reducing costs
- High resolution I6K camera technology allows 100% verification of the ScanTrust QRcode - satisfying client requirements and mitigated Reynders business risks
- DISCOVERY Multiscan allows Reynders to fully exploit the growth in secure packaging printing
- Reynders has strengthened its position as a leading provider of innovative, cost effective label and packaging printing services.

"WITH THE COMBINED SCANTRUST AND LAKE IMAGE SOLUTION IN PLACE, WE CAN NOW FULLY AUTOMATE OUR WORKFLOW ACCORDING TO OUR HIGH STANDARDS AND HAVE THE REASSURANCE THAT WE ARE DELIVERING A QUALITY, ERROR FREE PRODUCT TO THIS PRESTIGIOUS CLIENT."
